

r5 Dead-Zone Analysis: β_1 Distribution vs. ± 1 Threshold (3000 timesteps across 1 eval episodes)

(A) β_1 Distribution — all values far from ± 1 threshold
r5 fires +1 whenever $|\beta_1| < 1$, -1 whenever $|\beta_1| > 1$

(B) r5 Value Distribution — r5 = -1 never fires
All non-warmup timesteps receive r5 = +1 (false positive)
