

Anatomy of the fixed-routing world: DS layer (urgent0, mean over seeds)

(1) Distributor state (rung c)

(2) Up-to targets: the HEALTHY chain's target balloons (~900) as it absorbs the surge; the dead chain's falls with its rerouted demand

(3) Dead-factory queue: modest during-disruption orders sit at the dead MN for up to 48 periods (441k backlog cost); the post-recovery order spike feeds the glut
