

Anatomy of the fixed-routing world: HC layer (urgent0, mean over seeds)

(1) Trust collapses against the dead chain and recovers after (rung c, $\delta'=0.3$)

(2) Order routing: trust⁴ redirects within ~10 periods (baseline never does)

(3) Receipts follow routing with pipeline lag; note the late DS_disrupted deliveries after recovery (the glut source)

(4) The write-off in action: stale pipeline ignored for ordering, but still delivers later
